Maximum Flow and Minimum Cut

Max flow and min cut.

- Two very rich algorithmic problems.
- Cornerstone problems in combinatorial optimization.
- Beautiful mathematical duality.

Nontrivial applications / reductions.

- Data mining.
- Open-pit mining.
- Project selection.
- Airline scheduling.
- Bipartite matching.
- Baseball elimination.
- Image segmentation.
- Network connectivity.
- Network reliability.
- Distributed computing.
- Egalitarian stable matching.
- Security of statistical data.
- Network intrusion detection.
- Multi-camera scene reconstruction.
- Many many more ...

Minimum Cut Problem

Flow network.

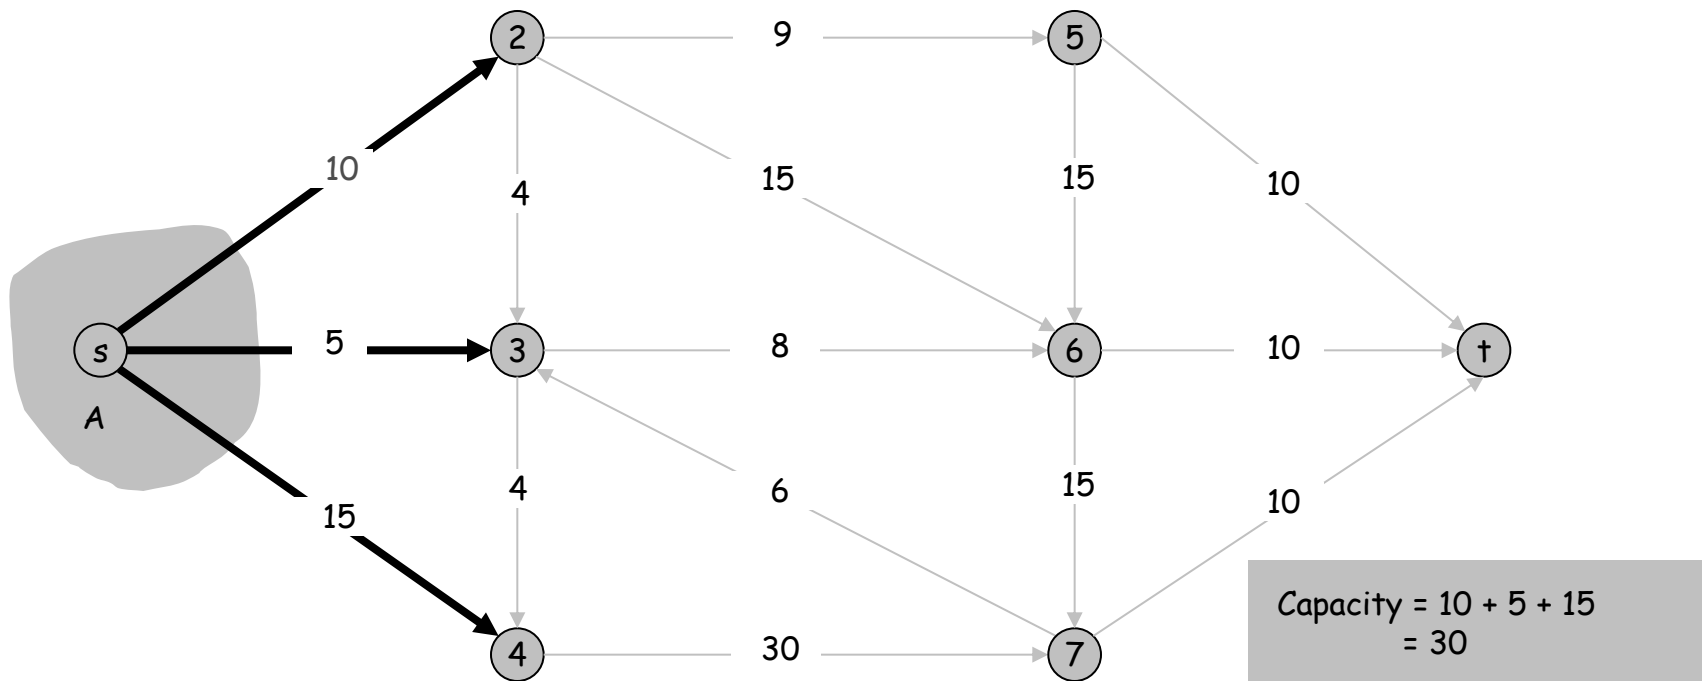

- Abstraction for material **flowing** through the edges.
- $G = (V, E)$ = directed graph, no parallel edges.
- Two distinguished nodes: s = source, t = sink.
- $c(e)$ = capacity of edge e .

Cuts

Def. An **s-t cut** is a partition (A, B) of V with $s \in A$ and $t \in B$.

Def. The **capacity** of a cut (A, B) is: $cap(A, B) = \sum_{e \text{ out of } A} c(e)$

Cuts

Def. An **s-t cut** is a partition (A, B) of V with $s \in A$ and $t \in B$.

Def. The **capacity** of a cut (A, B) is: $cap(A, B) = \sum_{e \text{ out of } A} c(e)$

Minimum Cut Problem

Min s-t cut problem. Find an s-t cut of minimum capacity.

Flows

Def. An **s-t flow** is a function that satisfies:

- For each $e \in E$: $0 \leq f(e) \leq c(e)$ [capacity]
- For each $v \in V - \{s, t\}$: $\sum_{e \text{ in to } v} f(e) = \sum_{e \text{ out of } v} f(e)$ [conservation]

Def. The **value** of a flow f is: $v(f) = \sum_{e \text{ out of } s} f(e)$.

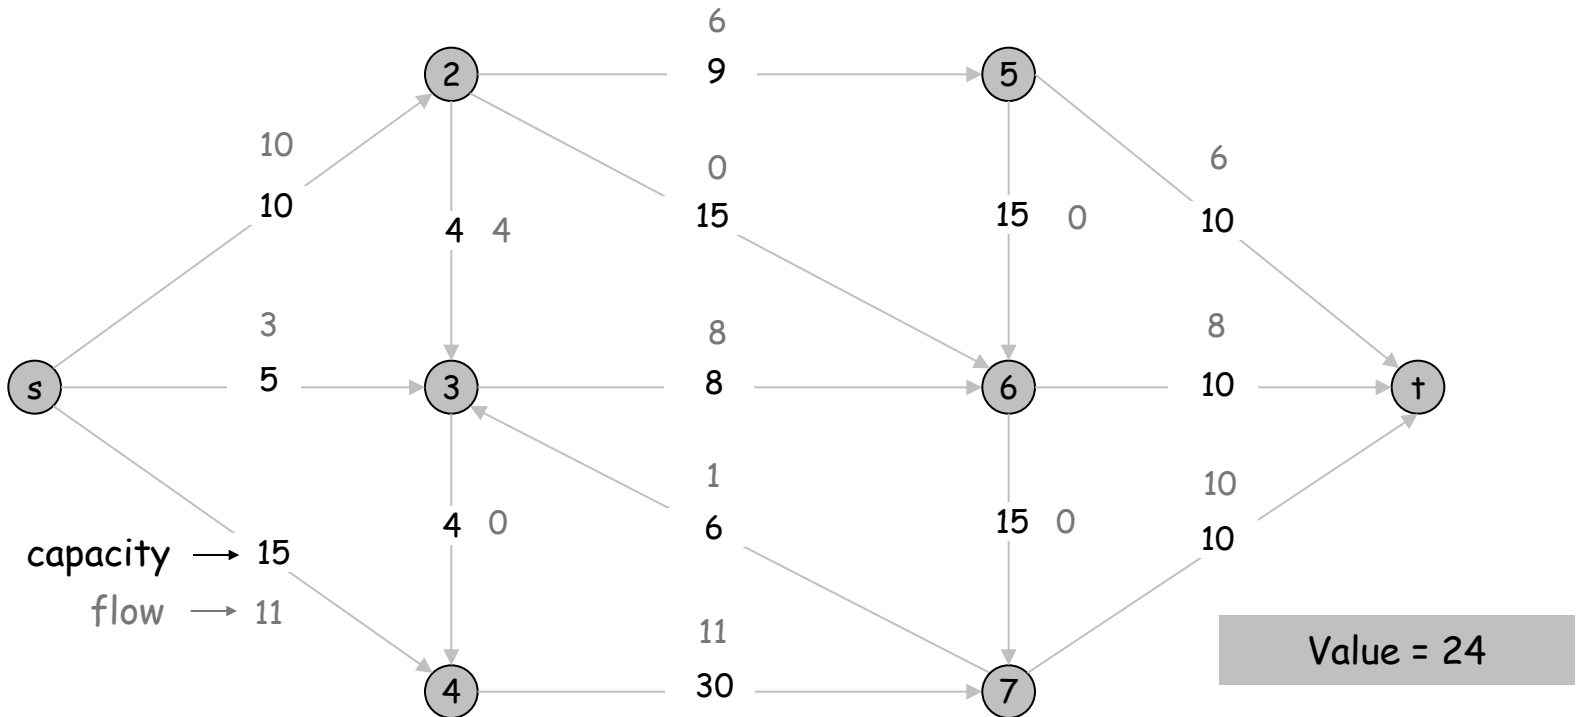

Flows

Def. An **s-t flow** is a function that satisfies:

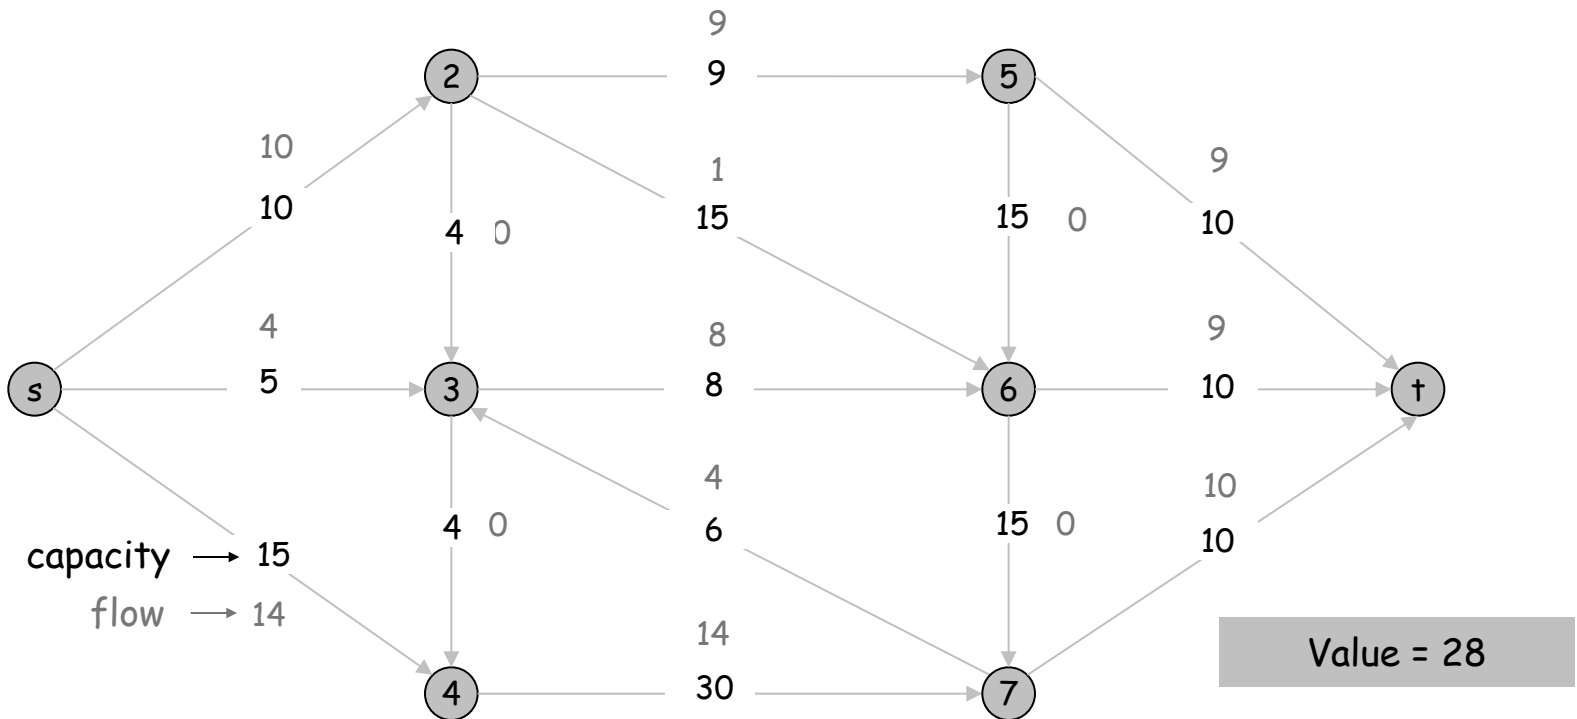

- For each $e \in E$: $0 \leq f(e) \leq c(e)$ [capacity]
- For each $v \in V - \{s, t\}$: $\sum_{e \text{ in to } v} f(e) = \sum_{e \text{ out of } v} f(e)$ [conservation]

Def. The **value** of a flow f is: $v(f) = \sum_{e \text{ out of } s} f(e)$.

Maximum Flow Problem

Max flow problem. Find s-t flow of maximum value.

Flows and Cuts

Flow value lemma. Let f be any flow, and let (A, B) be any s - t cut. Then, the net flow sent across the cut is equal to the amount leaving s .

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) = v(f)$$

Flows and Cuts

Flow value lemma. Let f be any flow, and let (A, B) be any s - t cut. Then, the net flow sent across the cut is equal to the amount leaving s .

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) = v(f)$$

Flows and Cuts

Flow value lemma. Let f be any flow, and let (A, B) be any s - t cut. Then, the net flow sent across the cut is equal to the amount leaving s .

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) = v(f)$$

Flows and Cuts

Flow value lemma. Let f be any flow, and let (A, B) be any s - t cut. Then

$$\sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) = v(f).$$

Pf.

$$v(f) = \sum_{e \text{ out of } s} f(e)$$

by flow conservation, all terms
except $v = s$ are 0

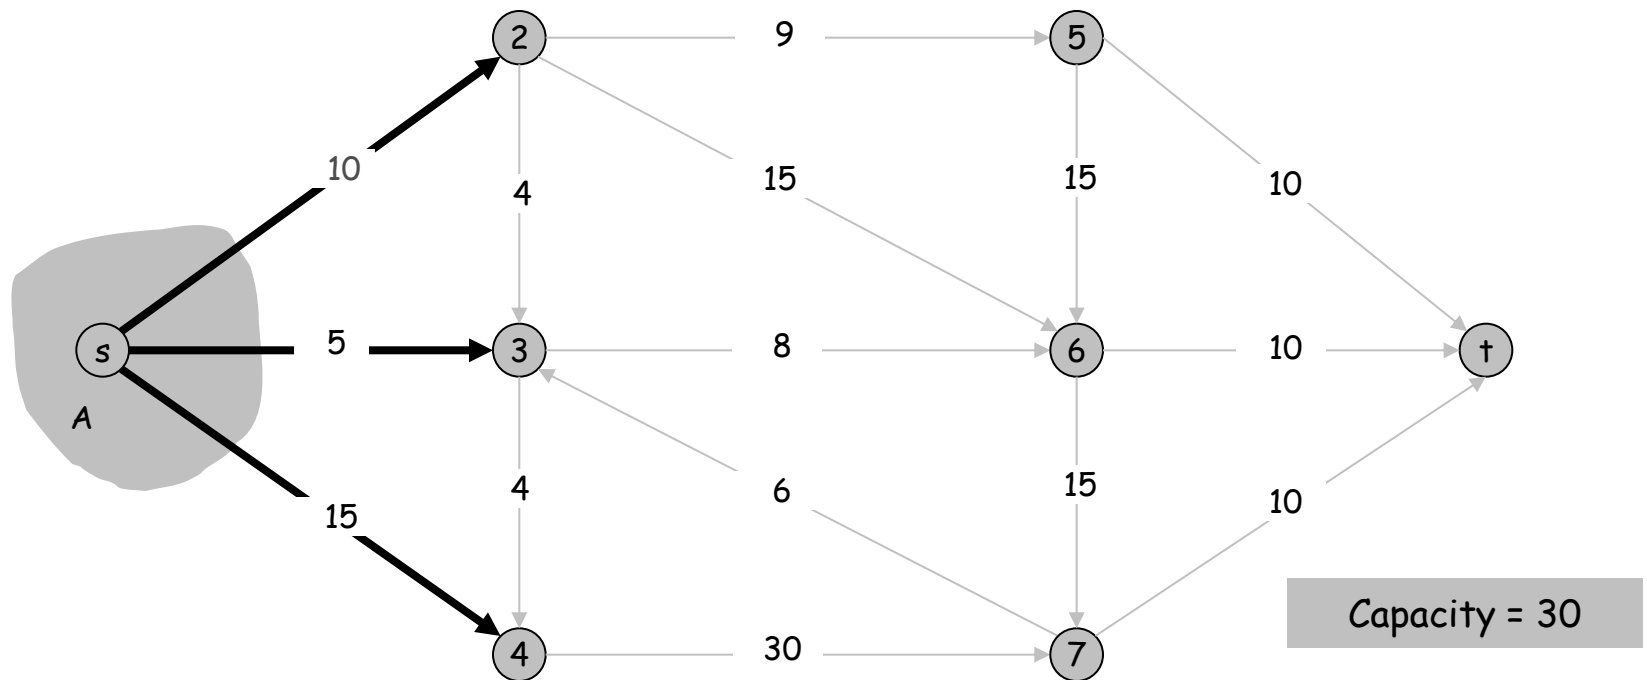

$$\longrightarrow = \sum_{v \in A} \left(\sum_{e \text{ out of } v} f(e) - \sum_{e \text{ in to } v} f(e) \right)$$

$$= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e).$$

Flows and Cuts

Weak duality. Let f be any flow, and let (A, B) be any s - t cut. Then the value of the flow is at most the capacity of the cut.

Cut capacity = 30 \Rightarrow Flow value ≤ 30

Flows and Cuts

Weak duality. Let f be any flow. Then, for any s - t cut (A, B) we have $v(f) \leq \text{cap}(A, B)$.

Pf.

$$\begin{aligned} v(f) &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) \\ &\leq \sum_{e \text{ out of } A} c(e) \\ &\leq \sum_{e \text{ out of } A} c(e) \\ &= \text{cap}(A, B) \quad \square \end{aligned}$$

Certificate of Optimality

Corollary. Let f be any flow, and let (A, B) be any cut. If $v(f) = \text{cap}(A, B)$, then f is a max flow and (A, B) is a min cut.

Value of flow = 28

Cut capacity = 28 \Rightarrow Flow value ≤ 28

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with $f(e) = 0$ for all edge $e \in E$.
- Find an s - t path P where each edge has $f(e) < c(e)$.
- Augment flow along path P .
- Repeat until you get stuck.

Flow value = 0

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with $f(e) = 0$ for all edge $e \in E$.
- Find an s - t path P where each edge has $f(e) < c(e)$.
- Augment flow along path P .
- Repeat until you get stuck.

Flow value = 20

Towards a Max Flow Algorithm

Greedy algorithm.

- Start with $f(e) = 0$ for all edge $e \in E$.
- Find an s - t path P where each edge has $f(e) < c(e)$.
- Augment flow along path P .
- Repeat until you get **stuck**.

↖ locally optimality \nRightarrow global optimality

Residual Graph

Original edge: $e = (u, v) \in E$.

- Flow $f(e)$, capacity $c(e)$.

Residual edge.

- "Undo" flow sent.
- $e = (u, v)$ and $e^R = (v, u)$.
- Residual capacity:

$$c_f(e) = \begin{cases} c(e) - f(e) & \text{if } e \in E \\ f(e) & \text{if } e^R \in E \end{cases}$$

Residual graph: $G_f = (V, E_f)$.

- Residual edges with positive residual capacity.
- $E_f = \{e : f(e) < c(e)\} \cup \{e^R : f(e) > 0\}$.

Augmenting path

Def. An **augmenting path** is a simple $s \rightarrow t$ path in the residual graph G_f

Def. The **bottleneck capacity** of an augmenting path P is the minimum residual capacity of any edge in P .

Key property. Let f be a flow and let P be an augmenting path in G_f , then after calling $f' \leftarrow \text{Augment}(f, c, P)$, the resulting f' is flow and

$$v(f') = v(f) + \text{bottleneck}(G_f, P)$$

Ford-Fulkerson Algorithm

G :

Augmenting Path Algorithm

```
Augment(f, c, P) {  
    b ← bottleneck(P)  
    foreach e ∈ P {  
        if (e ∈ E) f(e) ← f(e) + b  
        else      f(eR) ← f(eR) - b  
    }  
    return f  
}
```

forward edge

reverse edge

```
Ford-Fulkerson(G, s, t, c) {  
    foreach e ∈ E f(e) ← 0  
    Gf ← residual graph  
  
    while (there exists augmenting path P) {  
        f ← Augment(f, c, P)  
        update Gf  
    }  
    return f  
}
```

Max-Flow Min-Cut Theorem

Augmenting path theorem. Flow f is a max flow iff there are no augmenting paths.

Max-flow min-cut theorem. [Elias-Feinstein-Shannon 1956, Ford-Fulkerson 1956]
The value of the max flow is equal to the value of the min cut.

Pf. We prove both simultaneously by showing TFAE (the following are equivalent) :

- (i) There exists a cut (A, B) such that $v(f) = \text{cap}(A, B)$.
- (ii) Flow f is a max flow.
- (iii) There is no augmenting path relative to f .

(i) \Rightarrow (ii) This was the corollary to weak duality lemma.

(ii) \Rightarrow (iii) We show contrapositive.

- Let f be a flow. If there exists an augmenting path, then we can improve f by sending flow along path.

Proof of Max-Flow Min-Cut Theorem

(iii) \Rightarrow (i)

- Let f be a flow with no augmenting paths.
- Let A be set of vertices reachable from s in residual graph.
- By definition of A , $s \in A$.
- By definition of f , $t \notin A$.

$$\begin{aligned} v(f) &= \sum_{e \text{ out of } A} f(e) - \sum_{e \text{ in to } A} f(e) \\ &= \sum_{e \text{ out of } A} c(e) \\ &= \text{cap}(A, B) \quad \blacksquare \end{aligned}$$

$f(e) = 0$, if not, there will be a backward edge in G_f ,
Violate no augmenting paths in G_f

If not, there will be a forward edge in G_f ,
Violate no augmenting paths in G_f

original network

Running Time

Assumption. All capacities are integers between 1 and $C = \sum_{e \text{ out of } s} c(e)$.

Invariant. Every flow value $f(e)$ and every residual capacity $c_f(e)$ remains an integer throughout the algorithm.

Theorem. The algorithm terminates in at most $v(f^*) \leq C$ iterations.

Pf. Each augmentation increase value by at least 1. •

To find an s - t path in G_f , say by BFS, $O(m+n)$ with $m \geq n/2$,
Procedure $\text{augment}(f, P)$ takes $O(n)$, as the path has at most $n-1$ edges

Corollary. If $C = 1$, Ford-Fulkerson runs in $O(mn)$ time. ↗

Integrality theorem. If all capacities are integers, then there exists a max flow f for which every flow value $f(e)$ is an integer.

Pf. Since algorithm terminates, theorem follows from invariant. •
